Are you curious about how and why the universe of the big and small behave the way they do? Have you even wondered why common sense does not apply to the quantum mechanical world of subatomic particles or how three-dimensional space can be undergoing a spatial expansion in universe consisting of only four dimensional space-time? For example because quantum mechanics predicts that there is a non-zero probability one can observe a particle anywhere in the universe before an observation or measurement is made, many seemly rational scientists assume that a particle simultaneously exists in at every point in space only to materialize when it is observed. This prompted Einstein one of the greatest thinkers of modern times to say Do you really believe that the moon isn t there when nobody looks? In other words saying that nothing exists before one looks at it does not define the reality most of us believe in. Most if not all scientific advancements humankind has made have been based on concepts derived though qualitative observations of the environment However, modern physicists seem to have taken a different road to understanding the laws that govern our world. They spend most if not all of their time analyzing only its quantitative or mathematical properties. For example Einstein s theories define the universe in terms of only four dimensional space-time. However observations tell us that three-dimensional space is undergoing an expansion towards a higher spatial dimension. This presents a problem for the proponents of his theories because they do not include one. However by defining the relationship between energy/mass in terms of the constant velocity of light he provided a qualitative and quantitative means of...
