This pdf is so gripping and exciting. I actually have go through and that i am confident that i will going to read once again once more in the future. I discovered this publication from my dad and i advised this ebook to discover.

As a numerical example, let us suppose that the wave-length is ten times the interval $a + b$. Then, even if one-tenth only of the area of the grating be occupied by the metal strips, the coefficients of reflection and transmission are, for electrical vibrations parallel to the lengths, $1=879$, $l=121$. The same numbers in reverse order give the coefficients of reflection and transmission for electrical vibrations transverse to the length, when the apertures occupy only one-tenth of the area; viz., $7=121$, $J =879$. The coefficient of reflection in the one case, and of transmission in the other, increases rapidly with the wave-length. In the immediate neighbourhood of the grating the lines $y = \text{const}$, coincide with the curves $f = \text{const}$, of Fig. 1. These give the directions of the electric oscillation; but it must be remembered that the portions of the vertical line of symmetry which represented the metal strips in the electrostatic problem of 1 now correspond to apertures, and vice versa. The mathematical conditions to which the magnetic force y is subject in the problem of this section are exactly those which apply to the velocity-potential in the case of sound-waves incident directly on a grating of the kind considered. It appears that a series of narrow slits, with relatively broad opaque intervals, may transmit a very large proportion of the original sound, provided the...
