Excerpt: . . . 9 Development of forecast propagation database for NOAAs SIFT to Equations 1 and 2. Results showed that even with a three-fold increase in the slip value (sources L and M in Table 3, with the corresponding fault di-mensions) the leading tsunami wave height was within 25 of the maximum at Gages 1 and 2 (Fig. A7). The gages near the continental coast (Gages 3 and 4) showed more dierence for the leading tsunami waves, but are within 50 of the maximum at these gages. 3. 2. 3 Sensitivity to dip and rake angles A small variation of the dip and rake angles was tested for sensitivity of the tsunami wave heights. The epicenter of the source region is based on the Andreanov earthquake as shown in Table 5. Thedipangle was tested between 10 and 20 witha5 increment. A 10 to20 rangeistypical ofthesubductionearthquakes intheAASZ. Simulated results show that the leading tsunami waves (comparison at gages 1 and 2) increased by 30 , but the wave period and prole of the rst wave were very similar for all the dip values (Fig. A8). The variation of the rake angle ranges from a pure dip-slip mechanism (rake 90) to a 50 strike-slip mechanism with a rake value of 135. Comparing the simulated results at Gages 1 and 2, the tsunami wave height did not show a signicant variation (Fig. A9). The leading tsunami...
