Reviews

This ebook is fantastic. It is actually written in straightforward terms rather than hard to understand. It's been designed in an extremely straightforward way and it is merely soon after I finished reading through this ebook through which in fact modified me, alter the way I really believe.

Brand New Book ***** Print on Demand *****.Excerpt from On the Conformal Representation of Plane Curves Particularly for the Cases $P = 4, 5,$ and 6 In order to do this we must classify surfaces according to their deficiencies and treat each class separately. In the case $p=0$ there are no cuts on the surface and no integrals of the first kind. Integrals of the second kind exist on all surfaces. Let us select one of these, w , which has a single algebraic infinity. The function w being of weight one assumes one and only one value corresponding to each point of the n -leaved surface $F(x, y) = 0$. These values, real and complex, may be represented by the points in a plane by the ordinary representation of complex numbers. The given n -leaved surface can then be conformally represented upon a plane by means of the real and complex values assumed by w . If $p = 1$ two cuts are required to make the surface simply connected. We know that on any surface of deficiency p , there exist p linearly independent integrals of the first kind. Here then there exists only one which we will call u . Let the periods across the cuts be w_1 and w_2 If u has the value u_0 at a given point, for all the region around containing no branch point the u will vary continuously, and since u can be nowhere infinite, and since its values may be represented by points of a plane just as any complex number is represented, these points must all be within a parallelogram whose boundaries are determined by the limits of the values of the real and imaginary parts of u ...
