The addition of alum, by soaking a sample of the bread in cold distilled water, filtering well, and testing for sulphuric acid with hydrochloric acid and chloride of barium, as in the case of drinking-water. Unless the white precipitate is large, there will be no need of conducting the examination further. Sulphates may exist in the salt as in the water used in making the bread, as well as in the grain itself. Microscopical Examination.--The starch grains of wheaten flour in bread suffer rather more change than they do in the manufacture of biscnit. By the dough-making and baking the grains are enlarged, doubled up, and more or less distorted, and lose much of their refracting property. The smaller ones exhibit an angularity resembling detached grains of ricestarch. Stringy...
