But when the vapour-pressure exceeds the atmospheric it is possible for the surface tension curve of Fig. 93 to cut a gas curve of Fig. 92 at a less slope, and equilibrium is then unstable, as in boiling with bumping. We leave Fig. 94.--Apparatus for obtaining a Dust-Free Space. the reader to consider how the diagrams would lead us to expect that after the first singing discharge of bubbles no more large bubbles will be found till the boiling-point is reached. Condensation on Nuclei.--We have seen that the change from the liquid to the gaseous condition is essentially a surface phenomenon. It takes place at the top level surface in ordinary quiet evaporation, and in all probability at the surface of already existing bubbles or cavities in ebullition. The converse change in condensation is also generally a surface phenomenon, the condensation occurring on nuclei of dust or suspended matter other than air or vapour. This was first discovered by Coulier (*Jouituxl de Pharmacie et de Chemie*, xxii., pp. 165 and 254, 1875), and later again by Aitken (*Trans. R.S.E.*, xxx., pt. 1, p. 337), to whom we owe extensive investigations on the subject When a beam of sunlight crosses a room, the visibility of its track is due to particles of dust, many perhaps large enough to be seen, others quite beyond our range of sight. If the air be filtered through cottonwool this dust...
