Forgotten Books, 2017. Paperback. Condition: New. Language: English . Brand New Book ***** Print on Demand *****. Excerpt from Survey of Gossypium Hirsutum L. Germplasm Collections for Seed-Oil Percentage and Seed Characteristics The expanded use of cottonseed for food and feed is inevitable because of the need to maximize the efficiency and returns of our agricultural lands and because of world demand for food, especially protein. Although utilization research has produced a technological backlog of the information needed to develop new cottonseed products, the cotton breeders and geneticists do not have enough seed-quality information on the available germplasm resources to develop cottonseed-quality improvement programs. Moreover, not only is the genetic variability of cottonseed quality not known, but also the characteristics needed for new uses are not clearly defined. Cotton breeders are not able to make the adjustments demanded by new industrial uses. As more uses are developed, new parameters of seed quality will be identified, and various combinations will be desired. The geneticist must know what variability exists and how it can be manipulated to enhance seed quality and fill new needs. We implemented studies of seed quality in 1973, for basic to any improvement program is knowledge of the available genetic variability. Two major germplasm collections are available for use in the improvement of Upland cotton, and this report represents the results of screening these collections for oil content and physical characteristics of the seed.
