INTRODUCTION TO MULTIDIMENSIONAL INTEGRABLE EQUATIONS: THE INVERSE SPECTRAL TRANSFORM IN 21 DIMENSIONS

Springer. Hardcover. Book Condition: New. Hardcover. 292 pages. Dimensions: 9.3in. x 6.4in. x 0.9in. The soliton represents one of the most important of nonlinear phenomena in modern physics. It constitutes an essentially localized entity with a set of remarkable properties. Solitons are found in various areas of physics from gravitation and field theory, plasma physics, and nonlinear optics to solid state physics and hydrodynamics. Nonlinear equations which describe soliton phenomena are ubiquitous. Solitons and the equations which commonly describe them are also of great mathematical interest. Thus, the discovery in 1967 and subsequent development of the inverse scattering transform method that provides the mathematical structure underlying soliton theory constitutes one of the most important developments in modern theoretical physics. The inverse scattering transform method is now established as a very powerful tool in the investigation of nonlinear partial differential equations. The inverse scattering transform method, since its discovery some two decades ago, has been applied to a great variety of nonlinear equations which arise in diverse fields of physics. These include ordinary differential equations, partial differential equations, integrodifferential, and differential-difference equations. The inverse scattering transform method has allowed the investigation of these equations in a manner comparable to that of the Fourier method for linear equations. This item ships from multiple locations. Your book may arrive from Roseburg, OR, La Vergne, TN. Hardcover.
