Not illustrated. 1873 Excerpt: .characters renders this conclusion very improbable; darker specimens have the color of the feet more brownishyellow, the root of the front coxae and the tip of the tarsi darkbrown; the femora of such specimens often show conspicuous black, metallic-green longitudinal stripes; the darkest specimens have the whole basal half of the femora, and even more, of this black coloring, while the tibiae also are partly infuscated. Halteres yellowish-white. Wings with three brownish-black bands; the veins are black upon these bands, but ochre-yellow elsewhere, which gives the whole basal part of the wing an ochre-yellowish tinge. The first band begins at the costa with a short black stigma, is perpendicular and rather dark, as far as the fourth longitudinal vein and even beyond; the remainder of the band, as far as the posterior margin of the wing, is usually very faint; the small crossvein is a little...
