Brand New Book \*\*\*\*\* Print on Demand \*\*\*\*\*.Excerpt from **Critical Materials and Fabrication Issues for Pressure Vessels, Piping, Pumps, and Valves** The basis for the opinion expressed here is the complex variety of data available on Mechanical Properties of Materials, not only with respect to the manner in which it is obtained, but also in consideration of the interpretation to be placed on it in using it. There are many factors which affect the properties of materials, even when supplied to a standard specification. These factors include, among others, metal processing; chemical composition; product form, size, and thickness; heat treatment; and fabrication operations. The behavior of the material in its end use product is affected by the environment in which it is used and the operating conditions to which it will be subjected. The accumulation and analysis of data representative of the various material specifications and conditions of fabrication and use is a complex activity. A computer can be a very effective tool in aiding the engineer to evaluate and analyze the data for establishing design stresses for Code use or other design use. However, the judgment of the engineer is required in the management of this data to properly determine the appropriate analyses, selection of parameters, and criteria for design stresses suitable for the intended application.
