THE PROTEIN ELEMENT IN NUTRITION

Theclassics.us, United States, 2013. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book ***** Print on Demand *****.This historic book may have numerous typos and missing text. Purchasers can usually download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1912 edition. Excerpt: .of estimating the katabolism of protein involved in the disintegration of the true tissues, the problem of the nitrogenous requirements of the body from this standpoint would appear to be solved. Such a method has been supposed to be forthcoming in the determination of the creatininenitrogen of the urine, which has been regarded as a measure of the endogenous or tissue metabolism. If the nitrogen in the form of creatinine were a measure of the katabolism of the tissue cells, then the heat value of a diet being sufficient, the same amount of nitrogen supplied in the food as lost to the body in the form of creatinine should be sufficient to meet the protein requirements of the body, make good the loss due to true tissue change, and maintain the subject in a condition of nitrogenous equilibrium. The average amount of this creatinine-nitrogen is 0-6 gramme daily, remaining, according to Folin, practically constant, whether the diet be protein-rich or protein-free. The rational deduction to be drawn from this argument would be, if the creatininenitrogen is any measure of the protein requirements of the body, that under the stated conditions 0-6 gramme of assimilated nitrogen should be sufficient to maintain the body in nitrogenous equilibrium and insure the integrity of the tissue cells. The fact that approximately ten times this amount of nitrogen is necessary in a dietary in order to maintain the body in nitrogenous equilibrium, when the caloric value of the diet...
